Bus Characterization and Integrity Toolset

ITCN's new BCIT toolset makes testing MIL-STD-1553 data bus networks faster, easier and more accurate.

The BCIT troubleshoots bus networks and locates faults to within 6 inches on network cables up to 1,000 feet long. It also aids in identifying faulty LRUs that do not participate in bus communications properly by monitoring bus performance.

The BCIT's database driven, Windows-based software allows users to configure and save their test data and bus topology for future analysis, and provides color-coded graphic displays for intuitive fault indications.

NEW BCIT

*All-In-One Toolset for
MIL-STD-1553 Network Analysis*

Benefits and Features:

1. Save time and money by locating problems faster and more precisely.
2. Easy to set up and use software.
3. Find cabling faults to within 6 inches, dramatically reducing detection time.
4. Track maintenance and recurring problems with comparative analysis against historical data.
5. Protect classified environments with a removable hard disk and memory write protection.
